1. No. Data in memory can only be accessed when the computer is on and an application is running. Files, on the other hand, are stored on a lasting medium such as a hard disk. They are used in applications, but they are, by nature, separate from the program, which means that they can be used by multiple applications.

2. import java.io.File;

3. The “\” should be “/”

4. a) The try-catch-finally statement
   b)

```
try
{
        <statements>
}

catch (FileAlreadyExistsException e)
{
        System.out.prinln(“File Name Already Exsists”);
        System.err.println("IOException: " + e.getMessage());
}
```

5. a) err stream
   b) The error message occurs on the screen (specifically in Eclipse, it appears in the console)

6. a) The file stream keeps track of operations such as reading the contents, writing over existing contents, and adding to the existing contents.
   b) The carriage return character (Cr) and a line feed character (Lf).

7. The FileWriter and BufferedWriter classes

8.

```
in = new FileReader(dataFile);
readFile = new BufferedReader(in);

while ((amount = readFile.readLine()) ! null)
{
```

```
int number = Double.parseDouble(amount);

totalbalance += number;
}
```

9. Object serialization refers to the process of writing information into the file. Object deserialization, on the other hand, does the opposite. It reads/retrieves that data stored in the file.

10. A serializable interface must be implemented if objects of a class are to be written to a file.
